

ABSTRACT

A conversion kit for an arrow rest having an elongated wire having two ends and a first loop between the first and second ends . Attached to the first end of the wire is a weight and the second end features a second loop. A connecting string attaches the first loop to a bus cable of an archery bow. The second loop is attached to an arrow rest which is attached to the archery bow. The conversion kit for an arrow rest allows the arrow rest to rotate faster so that the arrow rest does not interfere with an arrow when a user draws and releases the bus cable of the archery bow.
